WPF 4.0 is a complete rewrite of WPF, and this new version introduces many new features and improvements. WPF has always been supported by .NET Framework since version 2.0 and is one of the main components included with .NET Framework. WPF 4.0 improvements XAML for controls

The first thing you should be aware of is that now, the standard controls provided by .NET Framework are named correctly according to the version of the .NET Framework you are using. Before, the control name was based on the specific version of the control in the package being the same as the version of the .NET Framework on your machine. For instance, the Label and Button controls have always been called “System.Windows.Forms.Label” and “System.Windows.Forms.Button”, but now they are called “System.Windows.Controls.Label” and “System.Windows.Controls.Button”. Backwards Compatibility

Another thing to be aware is that the WPF control names are no longer backward compatible with previous versions. In this case, you need to change the name of the control when you migrate your project to WPF. If your application is based on previous versions of the framework, you can still use the previous names, but in this case 09e8f5149f
