PS: The rest are just ignored in the numbers. A: In my case, the file was created by "1.1 v1.2" which means there are more than one installation with some minor version and major version difference. After I removed the "1.1 v1.2", the files get packed by "1.2 v1.2" and the extensions will be the same. Therefore, the.INF file can be unpacked and there will be no problem in unpacking after being packed. This site uses cookies to deliver our services and to show you relevant ads and job listings. This is my first attempt at using the VST Plugin Template Generator for creating a VST plugin UI! This time, I will show you how you can have a working VST plugin inside a DSPKIT rack! First things first. Let's get started with the sample project and go over the steps I followed to get it to work. The main project folder in the DSPKIT git repository contains three folders: samples/pkt/rack/simple, samples/pkt/rack/simple-vst, and samples/pkt/rack/simple-vst-gui. First, the name of the vst plugin project is samples/pkt/rack/simple-vst, so if you have a vst plugin already with a different name, you will need to change it when copying it into the samples/pkt/rack/simple-vst folder. Inside samples/pkt/rack/simple-vst you will find the project file, a few sample.vst templates, and the sample UI project files: ui.js and ui.html. The project file shows the name of the project file and the location of the vst file to be used. We will copy the simple.vst template file from one of the vst samples and paste it into the example project, as well as copy and edit the new template file to remove some of the VST specific code.
