I have gone through the process of starting a new activity. My question is: Is it possible to keep the activity running in the background for an app in general, even if the user is not on it? In other

words, can the user leave the home screen and come back at any moment later without the activity being "reactivated". A: No, you can't keep activity running in the background. The Android framework deactivates the activity of an application, when the application is not focused. That is, it is not visible to the user, though the activity is still running. The usual strategy for being able to come back and find the activity is as following: Define a permanent process. There are two ways to get this done: use services, use the process component in activities. In both cases, the permanent process remains alive, no matter what other applications are running. Why your question: There is a misconception that you might have about the concept "background activity". Those activities start when the user starts an activity, and they are then running on a background thread of the main application's process. Q: Can't convert date value to yyyy-mm-dd format in view in ASP.Net MVC I have a view (in ASP.Net MVC

3) which is returning a list of orders which have an End date. My table looks like this: Name | Date | End date
